“Potentials of Production Side Streams”

Out of this so-called “side streams from food production”, which normally have a very low added value, it is nowadays possible to create through suitable processing very valuable dietary fiber concentrates.

According to well-known scientific knowledge, those dietary fibers have a significant influence in reducing the non-communicable-diseases (NCD) like overweight, obesity, diabetes type II, cardio-vascular diseases, any many more.

Also according to the opinion of many very famous scientists those dietary fibers have a huge potential for cost-savings in public health sector.

The growing demand of the consumers for food out of natural raw materials was for JRS already 25 years ago the starting point to establish groundbreaking research & developments in this sector of adding value to natural raw materials.

In this regard, it was possible to develop for the food industry new raw materials with outstanding nutritional benefits like up to 97% of dietary fiber content, which offer the producer also a so far unknown variety in possible application areas due to their neutral and inert behavior.

Food markets around the globe appreciate those dietary fiber concentrates and meanwhile the family-owned company JRS from Baden Württemberg is the global market leader for dietary fiber concentrates coming out of side streams from natural food production.
